Safety Information

A IMPORTANT

Read the safety warnings and instructions in this manual before pump installation and start-up. Failure to comply with the recommendations stated in this manual could damage the pump and void factory warranty.

When the pump is used for materials that tend to settle out or solidify, the pump should be flushed after each use to prevent damage. In freezing temperatures the pump should be completely drained between uses.

A CAUTION

Before pump operation, inspect all fasteners for loosening caused by gasket creep. Retighten loose fasteners to prevent leakage. Follow recommended torques stated in this manual.

Nonmetallic pumps and plastic components are not UV stabilized. Ultraviolet radiation can damage these parts and negatively affect material properties. Do not expose to UV light for extended periods of time.

WARNING

Pump not designed, tested or certified to be powered by compressed natural gas. Powering the pump with natural gas will void the warranty.

WARNING

The use of non-OEM replacement parts will void (or negate) agency certifications, including CE, ATEX, CSA, 3A and EC1935 compliance (Food Contact Materials). Warren Rupp, Inc. cannot ensure nor warrant non-OEM parts to meet the stringent requirements of the certifying agencies.

MARNING

When used for toxic or aggressive fluids, the pump should always be flushed clean prior to disassembly.

Before maintenance or repair, shut off the compressed air line, bleed the pressure, and disconnect the air line from the pump. Be certain that approved eye protection and protective clothing are worn at all times. Failure to follow these recommendations may result in serious injury or death.

Airborne particles and loud noise hazards. Wear eye and ear protection.

In the event of diaphragm rupture, pumped material may enter the air end of the pump, and be discharged into the atmosphere. If pumping a product that is hazardous or toxic, the air exhaust must be piped to an appropriate area for safe containment.

Take action to prevent static sparking. Fire or explosion can result, especially when handling flammable liquids. The pump, piping, valves, containers and other miscellaneous equipment must be properly grounded.

This pump is pressurized internally with air pressure during operation. Make certain that all fasteners and piping connections are in good condition and are reinstalled properly during reassembly.

Use safe practices when lifting

ATEX Pumps - Conditions For Safe Use

- 1. Ambient temperature range is as specified in tables 1 to 3 on the next page (per Annex I of DEKRA 18ATEX0094X)
- ATEX compliant pumps are suitable for use in explosive atmospheres when the equipment is properly grounded in accordance with local electrical codes
- Non-Metallic ATEX Pumps only See Explanation of Pump Nomenclature / ATEX Details Page
 Conductive Polypropylene, conductive Acetal or conductive PVDF pumps are not to be installed in applications where the
 pumps may be subjected to oil, greases and hydraulic liquids.
- 4. The optionally provided solenoids shall be protected by a fuse corresponding to its rated current (max 3*Irat according to EN 60127) or by a motor protecting switch with short circuit and thermal instantaneous tripping (set to the rated current) as short circuit protection. For solenoids with a very low rated current, a fuse with the lowest current value according to the indicated standard will be sufficient. The fuse may be accommodated in the associated supply unit or shall be separately arranged. The rated voltage of the fuse shall be equal or greater than the stated rated voltage of the solenoid. The breaking capacity of the fuse shall be as high as or higher than the maximum expected short circuit current at the location of the installation (usually 1500 A). The maximum permissible ripple is 20% for all dc solenoids.

 *Not applicable for all pump models See Explanation of Pump Nomenclature / ATEX Details Page
- 5. When operating pumps equipped with non-conductive diaphragms that exceed the maximum permissible projected area, as defined in EN ISO 80079-36: 2016 section 6.7.5 table 8, the following protection methods must be applied
 - Equipment is always used to transfer electrically conductive fluids or
 - Explosive environment is prevented from entering the internal portions of the pump, i.e. dry running.
- 6. Pumps provided with the pulse output kit and used in the potentially explosive atmosphere caused by the presence of the combustible dust shall be installed in such a way that the pulse output kit is protected against impact *Not applicable for all pump models See Explanation of Pump Nomenclature / ATEX Details Page

Materials

Material Profile:		Operating Temperatures:	
CAUTION! Operating temperature limitations are as follows:	Max.	Min.	
Nitrile: General purpose, oil-resistant. Shows good solvent, oil, water and hydraulic fluid resistance. Should not be used with highly polar solvents like acetone and MEK, ozone, chlorinated hydrocarbons and nitro hydrocarbons.	190°F 88°C	-10°F -23°C	
Santoprene®: Injection molded thermoplastic elastomer with no fabric layer. Long mechanical flex life. Excellent abrasion resistance.	275°F 135°C	-40°F -40°C	
Virgin PTFE: (PFA/TFE) Chemically inert, virtually impervious. Very few chemicals are known to chemically react with PTFE; molten alkali metals, turbulent liquid or gaseous fluorine and a few fluoro-chemicals such as chlorine trifluoride or oxygen difluoride which readily liberate free fluorine at elevated temperatures.	220°F 104°C	-35°F -37°C	

Maximum and Minimum Temperatures are the limits for which these materials can be operated. Temperatures coupled with pressure affect the longevity of diaphragm pump components. Maximum life should not be expected at the extreme limits of the temperature ranges.

Metals:

Stainless Steel: Equal to or exceeding ASTM specification A743 CF-8M for corrosion resistant iron chromium, iron chromium nickel and nickel based alloy castings for general applications. Commonly referred to as 316 Stainless Steel in the pump industry.

For specific applications, always consult the Chemical Resistance Chart.

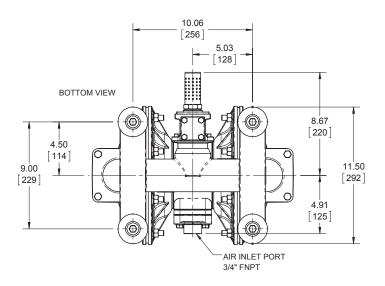

Dimensional Drawings

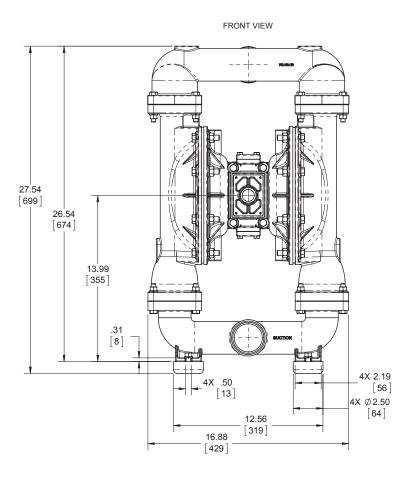

T20 Metallic

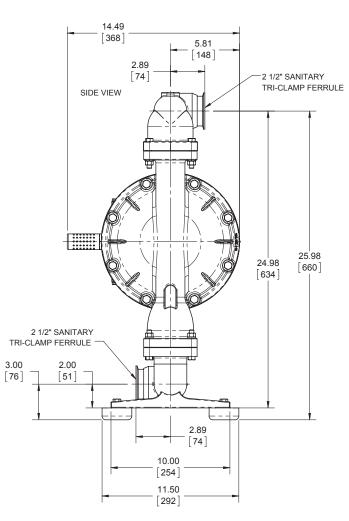

The dimensions on this drawing are for reference only. A certified drawing can be requested if physical dimensions are needed.

Dimensions in Inches

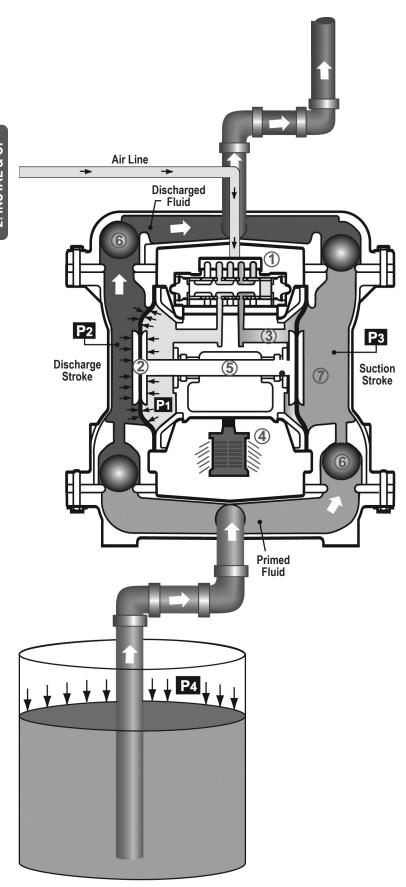

Dimensional Tolerance: ± 1/8" (± 3mm)

Principle of Pump Operation

Air-Operated Double Diaphragm (AODD) pumps are powered by compressed air or nitrogen.

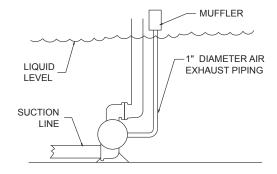

The main directional (air) control valve ① distributes compressed air to an air chamber, exerting uniform pressure over the inner surface of the diaphragm ②. At the same time, the exhausting air ③ from behind the opposite diaphragm is directed through the air valve assembly(s) to an exhaust port ④.

As inner chamber pressure (P1) exceeds liquid chamber pressure (P2), the rod ⑤ connected diaphragms shift together creating discharge on one side and suction on the opposite side. The discharged and primed liquid's directions are controlled by the check valves (ball or flap)⑥ orientation.

The pump primes as a result of the suction stroke. The suction stroke lowers the chamber pressure (P3) increasing the chamber volume. This results in a pressure differential necessary for atmospheric pressure (P4) to push the fluid through the suction piping and across the suction side check valve and into the outer fluid chamber T.

Suction (side) stroking also initiates the reciprocating (shifting, stroking or cycling) action of the pump. The suction diaphragm's movement is mechanically pulled through its stroke. The diaphragm's inner plate makes contact with an actuator plunger aligned to shift the pilot signaling valve. Once actuated, the pilot valve sends a pressure signal to the opposite end of the main directional air valve, redirecting the compressed air to the opposite inner chamber.

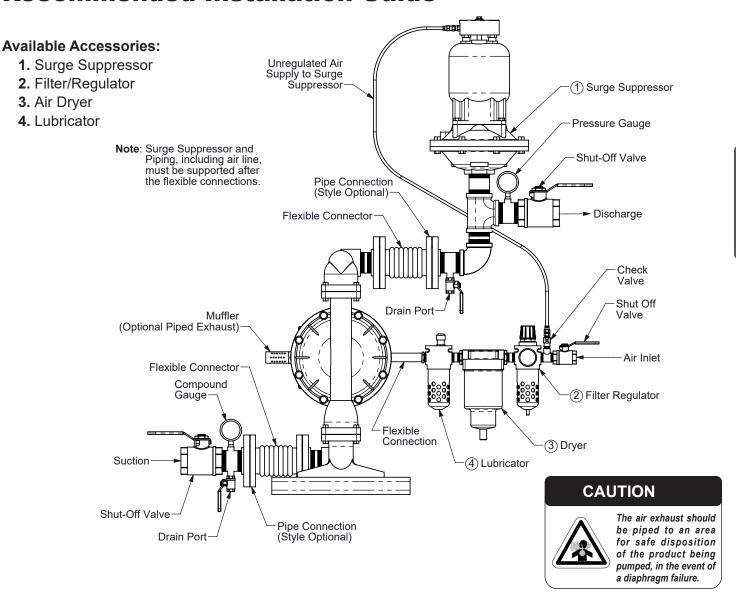

SUBMERGED ILLUSTRATION

Pump can be submerged if the pump materials of construction are compatible with the liquid being pumped. The air exhaust must be piped above the liquid level. When the pumped product source is at a higher level than the pump (flooded suction condition), pipe the exhaust higher than the product source to prevent siphoning spills.

Recommended Installation Guide

Installation And Start-Up

Locate the pump as close to the product being pumped as possible. Keep the suction line length and number of fittings to a minimum. Do not reduce the suction line diameter.

Air Supply

Connect the pump air inlet to an air supply with sufficient capacity and pressure to achieve desired performance. A pressure regulating valve should be installed to insure air supply pressure does not exceed recommended limits.

Air Valve Lubrication

The air distribution system is designed to operate WITHOUT lubrication. This is the standard mode of operation. If lubrication is desired, install an air line lubricator set to deliver one drop of SAE 10 non-detergent oil for every 20 SCFM (9.4 liters/sec.) of air the pump consumes. Consult the Performance Curve to determine air consumption.

Air Line Moisture

Water in the compressed air supply may cause icing or freezing of the exhaust air, causing the pump to cycle erratically or stop operating. Water in the air supply can be reduced by using a point-of-use air dryer.

Air Inlet And Priming

To start the pump, slightly open the air shut-off valve. After the pump primes, the air valve can be opened to increase air flow as desired. If opening the valve increases cycling rate, but does not increase the rate of flow, cavitation has occurred. The valve should be closed slightly to obtain the most efficient air flow to pump flow ratio.

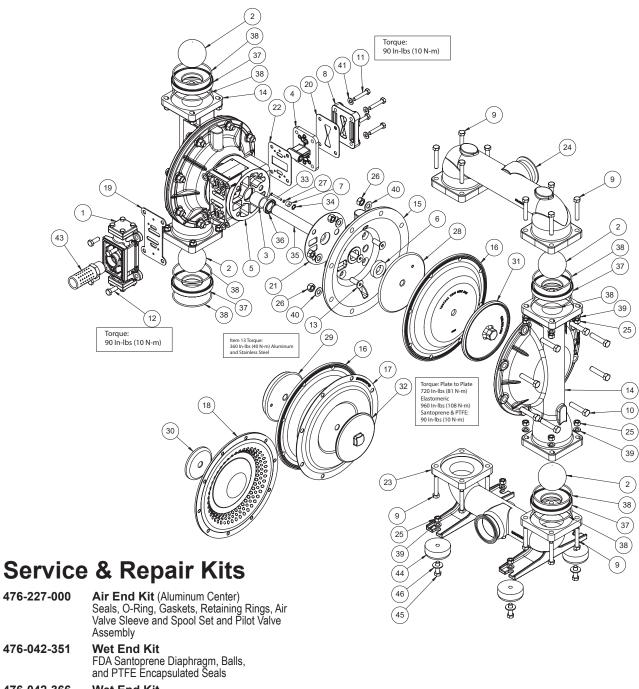

Troubleshooting Guide

Supply pressure	gractuator plunger. gractuator pressure meets or exceeds air ep. gractuator pressure pressu	Increase the inlet air pressure to the pump. Pump is designed for 1:1 pressure ratio at zero flow. (Does not apply to high pressure 2:1 units). Install gaskets with holes properly aligned. Remove pilot valve and inspect actuator plungers. Set lubricator on lowest possible setting or remove. Units are designed for lube free operation. Check the air line size and length, compressor capacity (HP vs. CFM required). Disassemble and inspect main air distribution valve, pilot valve and pilot valve actuators. Check for inadvertently closed discharge line valves. Clean discharge manifolds/piping. Increase the inlet air pressure to the pump. Pump is designed for 1:1 pressure ratio at zero flow. (Does not apply to high pressure 2:1 units). Remove muffler screen, clean or de-ice, and re-install. Disassemble pump chambers. Inspect for diaphragm rupture or loose diaphragm plate assembly. Disassemble and inspect wetted chambers. Remove or flush any obstructions. Check suction condition (move pump closer to product). Disassemble the wet end of the pump and manually dislodge obstruction in the check valve pocket. Clean out around valve ball cage and valve seat area. Replace valve ball or valve seat if damaged. Use heavier valve ball material. Worn valve ball or valve seat. Worn fingers in valve ball cage (replace part). Check Chemical Resistance Guide for compatibility. Inspect check valves and seats for wear and proper setting. Replace if necessary. Remove or flush obstruction. Check and clear all suction screens or strainers. For lifts exceeding 20' of liquid, filling the chambers with liquid will prime the pump in most cases. Visually inspect all suction-side gaskets and pipe connections. Disassemble pump chambers. Inspect for diaphragm rupture or loose diaphragm plate assembly. Set lubricator on lowest possible setting or remove. Units are designed for lube free operation.

Increase the inlet air pressure to the pump. Pump is designed for 1:1 pressure ratio at zero flow. (Does not apply to high pressure 2:1 units).
Excessive suct Air supply pres Undersized suc Restrictive or u Suction side ai Suction line is I Pumped fluid ir Check valve ot Check valve ar Entrained air or Product Leaking Diaphragm faili	uction side.	Check suction (move pump closer to product).
Air supply pres Undersized suc Restrictive or u Suction side air Suction line is I Pumped fluid ir Check valve or Check valve ar Entrained air or Product Leaking Diaphragm failt	e size, PSI, CFM).	Check the air line size, length, compressor capacity.
Undersized such Restrictive or undersized such Restrictive or undersized such side air Suction side air Suction line is In Pumped fluid in Check valve of Check valve are Entrained air or Product Leaking Diaphragm failst	ion lift.	For lifts exceeding 20' of liquid, filling the chambers with liquid will prime the pump in most cases.
Restrictive or u Suction side air Suction line is I Pumped fluid ir Check valve or Check valve ar Entrained air or Product Leaking Diaphragm failt	ssure or volume exceeds system hd.	Decrease inlet air (press. and vol.) to the pump. Pump is cavitating the fluid by fast cycling.
Suction side air Suction line is I Pumped fluid ir Check valve ob Check valve ar Entrained air or Product Leaking Diaphragm failt	ction line.	Meet or exceed pump connections.
Suction line is I Pumped fluid ir Check valve ob Check valve ar Entrained air o Product Leaking Diaphragm faile	ındersized air line.	Install a larger air line and connection.
Pumped fluid in Check valve ob Check valve ar Entrained air o Product Leaking Diaphragm fails	r leakage or air in product.	Visually inspect all suction-side gaskets and pipe connections.
Check valve at Check valve ar Entrained air or Product Leaking	blocked.	Remove or flush obstruction. Check and clear all suction screens or strainers.
Check valve ar Entrained air or Product Leaking Diaphragm failt	n air exhaust muffler.	Disassemble pump chambers. Inspect for diaphragm rupture or loose diaphragm plate assembly.
Product Leaking Diaphragm fails		Disassemble the wet end of the pump and manually dislodge obstruction in the check valve pocket.
Product Leaking Diaphragm faile	nd/or seat is worn or needs adjusting.	Inspect check valves and seats for wear and proper setting. Replace if necessary.
Todaot Loaking	r vapor lock in chamber(s).	Purge chambers through tapped chamber vent plugs. Purging the chambers of air can be dangerous.
Through Exhaust Diaphragm stre	ure, or diaphragm plates loose.	Replace diaphragms, check for damage and ensure diaphragm plates are tight.
l l	etched around center hole or bolt holes.	Check for excessive inlet pressure or air pressure. Consult Chemical Resistance Chart for compatibility with products, cleaners, temperature limitations and lubrication.
Premature Diaphragm Cavitation.		Enlarge pipe diameter on suction side of pump.
Failure Excessive floor	ded suction pressure.	Move pump closer to product. Raise pump/place pump on top of tank to reduce inlet pressure. Install Back pressure device (Tech bulletin 41r). Add accumulation tank or pulsation dampener.
Misapplication		Consult Chemical Resistance Chart for compatibility with products, cleaners, temperature limitations and lubrication.
installed incorre	(chemical/physical incompatibility).	Check Operating Manual to check for correct part and installation. Ensure outer plates have not been worn to a sharp edge.
Unbalanced Cycling Excessive suct	(chemical/physical incompatibility). aragm plates or plates on backwards, ectly or worn.	For lifts exceeding 20' of liquid, filling the chambers with liquid will prime the pump in most cases.
Undersized suc	(chemical/physical incompatibility). aragm plates or plates on backwards, ectly or worn. tion lift.	
Pumped fluid ir	(chemical/physical incompatibility). aragm plates or plates on backwards, ectly or worn. tion lift.	Meet or exceed pump connections.
Suction side air	(chemical/physical incompatibility). aragm plates or plates on backwards, ectly or worn. tion lift.	Disassemble pump chambers. Inspect for diaphragm rupture or loose diaphragm plate assembly.
Check valve ob	(chemical/physical incompatibility). pragm plates or plates on backwards, eactly or worn. tion lift. ction line.	
Check valve ar	(chemical/physical incompatibility). Irragm plates or plates on backwards, ectly or worn. Ition lift. Ition line. In air exhaust muffler. It leakage or air in product.	Disassemble pump chambers. Inspect for diaphragm rupture or loose diaphragm plate assembly. Visually inspect all suction-side gaskets and pipe connections. Disassemble the wet end of the pump and manually dislodge obstruction in the check valve pocket.
Entrained air o	(chemical/physical incompatibility). Irragm plates or plates on backwards, ectly or worn. Ition lift. Ition line. In air exhaust muffler. It leakage or air in product.	Disassemble pump chambers. Inspect for diaphragm rupture or loose diaphragm plate assembly. Visually inspect all suction-side gaskets and pipe connections.

- Rulon II is a registered tradename of Dixion Industries Corp.
- Ryton is a registered tradename of Phillips Chemical Co.
- Valox is a registered tradename of General Electric Co.

RECYCLING

Warren Rupp is an ISO14001 registered company and is committed to minimizing the impact our products have on the environment. Many components of SANDPIPER® AODD pumps are made of recyclable materials. We encourage pump users to recycle worn out parts and pumps whenever possible, after any hazardous pumped fluids are thoroughly flushed. Pump users that recycle will gain the satisfaction to know that their discarded part(s) or pump will not end up in a landfill. The recyclability of SANDPIPER products is a vital part of Warren Rupp's commitment to environmental stewardship.

Air Distribution Valve Servicing

See repair parts drawing, remove screws.

Step 1: Remove Hex Head Cap Screws (1-F).

Step 2: Remove end cap (1-E).

Step 3: Remove spool part of (1-B) (caution: do not scratch).

Step 4: Press sleeve (1-B) from body (1-A).

Step 5: Inspect O-Ring (1-D) and replace if necessary.

Step 6: Lightly lubricate O-Rings (1-D) on sleeve (1-B).

Step 7: Press sleeve (1-B) into body (1-A).

Step 8: Reassemble in reverse order, starting with step 3.

Note: Sleeve and spool (1-B) set is match ground to a specified clearance sleeve and spools (1-B) cannot be interchanged.

IMPORTANT

Read these instructions completely, before installation and start-up. It is the responsibility of the purchaser to retain this manual for reference. Failure to comply with the recommendations stated in this manual will damage the pump, and void factory warranty.

Air Valve Assembly Parts List

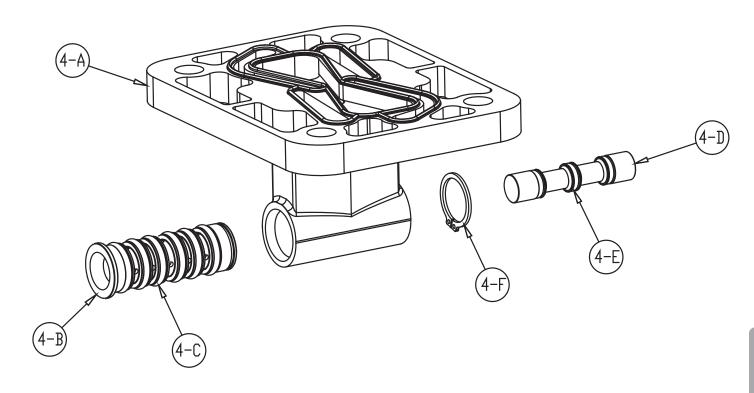

(OSE N	//Aluminum cemer	o only)	
Item	Part Number	Description	Qty
1	031.183.313	Air Valve Assembly	1
1-A	095.109.313	Body, Air Valve	1
1-B	031.139.000	Sleeve and Spool Set	1
1-C	132-029-552	Bumper	2
1-D	560.020.360	O-Ring	10
1-E	165.127.313	Cap, End	2
1-F	170.032.115	Hex Head Capscrew 1/4-20 x .75	8

Air Valve Assembly Parts List

(Use w	//Stainless Steel ce	enters only)	
Item	Part Number	Description	Qty
1	031.179.000	Air Valve Assembly	1
1-A	095.109.110	Body, Air Valve	1
1-B	031.139.000	Sleeve and Spool Set	1
1-C	132-029-552	Bumper	2
1-D	560.020.379	O-Ring	10
1-E	165.127.110	Cap, End	2
1-F	170.032.115	Hex Head Capscrew 1/4-20 x .75	8

Pilot Valve Assembly

Pilot Valve Servicing

With Pilot Valve removed from pump.

Step 1: Remove snap ring (4-F).

Step 2: Remove sleeve (4-B), inspect O-Rings (4-C), replace if required.

Step 3: Remove spool (4-D) from sleeve (4-B), inspect O-Rings (4E), replace if required.

Step 4: Lightly lubricate O-Rings (4-C) and (4-E).

Reassemble in reverse order.

Pilot Valve Assembly Parts List

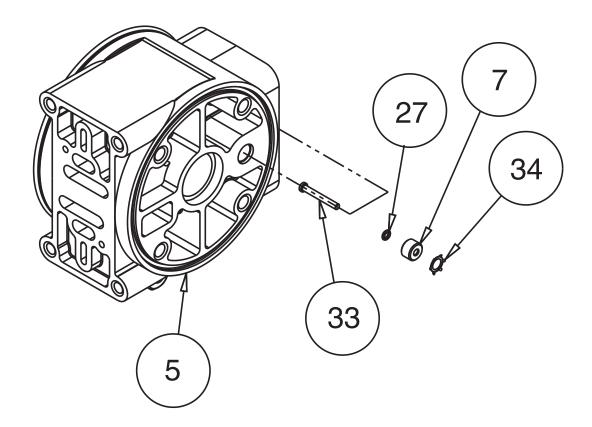

Item	Part Number	Description	Qty
4	095.110.313	Pilot Valve Assembly	1
4-A	095.095.313	Valve Body	1
4-B	755.051.000	Sleeve (With O-rings)	1
4-C	560.033.360	O.ring (Sleeve)	6
4-D	775.055.000	Spool (With O-rings)	1
4-E	560.023.360	O-ring (Spool)	3
4-F	675.037.080	Retaining Ring	1

For Pumps With Stainless Steel Center Section

Item	Part Number	Description	Qty
4	095.110.110	Pilot Valve Assembly	1
4-A	095.095.110	Valve Body	1
(includ	es all other items us	sed on 095.110.000)	

Intermediate Assembly Drawing

Intermediate Assembly Drawing

- **Step 1:** Remove plunger, actuator (33) from center of intermediate pilot valve cavity.
- Step 2: Remove Ring, Retaining (34), discard.
- **Step 3:** Remove bushing, plunger (7), inspect for wear and replace if necessary with genuine parts.
- **Step 4:** Remove O-Ring (27), inspect for wear and replace if necessary with genuine parts.
- **Step 5:** Lightly lubricate O-Ring (27) and insert into intermediate.
- Step 6: Reassemble in reverse order.

INTERMEDIATE REPAIR PARTS LIST

Item	Part Number	Description	Qty
5	114.024.313	Bracket, Intermediate	1
	114.024.110	Bracket, Intermediate	1
7	135.034.506	Bushing, Plunger	2
27	560.001.360	O-Ring	2
33	620.020.115	Plunger, Actuator	2
34	675.042.115	Ring, Retaining*	2
36	720.004.360	Seal, Diaphragm Rod	2

*Note: It is recommended that when plunger components are serviced, new retaining rings be installed.

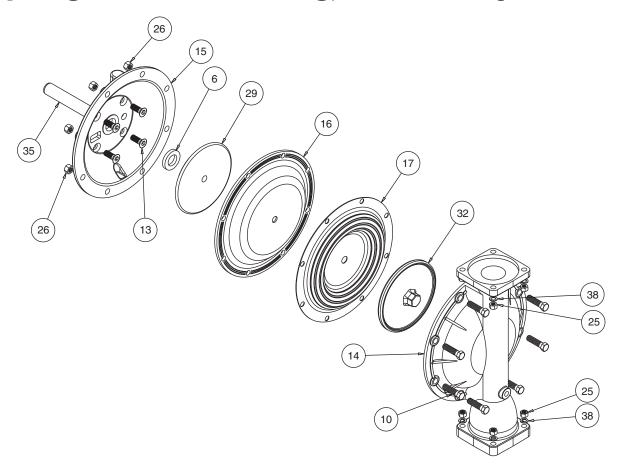

When the pumped product source is at a higher level than the pump (flooded suction condition), pipe the exhaust higher than the product source to prevent siphoning spills. In the event of a diaphragm failure a complete rebuild of the center section is recommended.

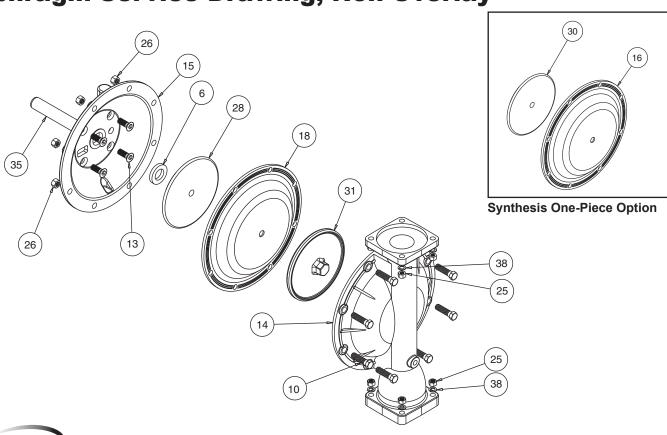

5: WET END

Diaphragm Service Drawing, with Overlay

Diaphragm Service Drawing, Non-Overlay

SANDPIPER[®]

DIAPHRAGM SERVICING

Step 1: With manifolds and outer chambers removed, remove diaphragm assemblies from diaphragm rod. **DO NOT** use a pipe wrench or similar tool to remove assembly from rod. Flaws in the rod surface may damage bearings and seal. Soft jaws in a vise are recommended to prevent diaphragm rod damage.

Step 1.A: NOTE: Not all inner diaphragm plates are threaded. Some models utilize a though hole in the inner diaphragm plate. If required to separate diaphragm assembly, place assembly in a vice, gripping on the exterior cast diameter of the inner plate. Turn the outer plate clockwise to separate the assembly.

Always inspect diaphragms for wear cracks or chemical attack. Inspect inner and outer plates for deformities, rust scale and wear. Inspect intermediate bearings for elongation and wear. Inspect diaphragm rod for wear or marks.

Clean or repair if appropriate. Replace as required.

Step 2: Reassembly: There are two different types of diaphragm plate assemblies utilized throughout the Sandpiper product line: Outer plate with a threaded stud, diaphragm, and a threaded inner plate.

Outer plate with a threaded stud, diaphragm, and an inner plate with through hole. Secure threaded inner plate in a vice. Ensure that the plates are being installed with the outer radius against the diaphragm.

Step 3: Lightly lubricate, with a compatible material, the inner faces of both outer and inner diaphragm plates when using on non Overlay diaphragms (For EPDM water is recommended). No lubrication is required.

Step 4: Push the threaded outer diaphragm plate through the center hole of the diaphragm. **Note:** Most diaphragms are installed with the natural bulge out towards the fluid side. S05, S07, and S10 non-metallic units are installed with the natural bulge in towards the air side.

Step 5: Thread or place, outer plate stud into the inner plate. For threaded inner plates use a torque wrench to tighten the assembly together. Torque values are called out on the exploded view.

Repeat procedure for second side assembly. Allow a minimum of 15 minutes to elapse after torquing then re-torque the assembly to compensate for stress relaxation in the clamped assembly.

Step 6: Thread one assembly onto the diaphragm rod with sealing washer (when used) and bumper.

Step 7: Install diaphragm rod assembly into pump and secure by installing the outer chamber in place and tightening the capscrews.

Step 8: On opposite side of pump thread the remaining assembly onto the diaphragm rod. Using a torque wrench tighten the assembly to the diaphragm rod. Align diaphragm through bolt holes always going forward past the recommended torque. Torque values are called out on the exploded view. **NEVER** reverse to align holes, if alignment cannot be achieved without damage to diaphragm, loosen complete assemblies rotate diaphragm and reassemble as described above.

Step 9: Complete assembly of entire unit. Synthesis One Piece Diaphragm Servicing (Bonded PTFE with integral plate) The One Piece diaphragm has a threaded stud installed in the integral plate at the factory. The inner diaphragm plate has a through hole instead of a threaded hole. Place the inner plate over the diaphragm stud and thread the first diaphragm / inner plate onto the diaphragm rod only until the inner plate contacts the rod. Do not tighten. A small amount of grease may be applied between the inner plate and the diaphragm to facilitate assembly. Insert the diaphragm / rod assembly into the pump and install the outer chamber. Turn the pump over and thread the second diaphragm / inner plate onto the diaphragm rod. Turn the diaphragm until the inner plate contacts the rod and hand tighten the assembly. Continue tightening until the bolt holes align with the inner chamber holes. DO NOT LEAVE THE ASSEMBLY LOOSE.

A IMPORTANT

Read these instructions completely, before installation and start-up. It is the responsibility of the purchaser to retain this manual for reference. Failure to comply with the recommendations stated in this manual will damage the pump, and void factory warranty.

5 - YEAR Limited Product Warranty

Warren Rupp, Inc. ("Warren Rupp") warrants to the original end-use purchaser that no product sold by Warren Rupp that bears a Warren Rupp brand shall fail under normal use and service due to a defect in material or workmanship within five years from the date of shipment from Warren Rupp's factory. Warren Rupp brands include Warren Rupp®, SANDPIPER®, SANDPIPER Signature Series[™], MARATHON[®], Porta-Pump[®], SludgeMaster[™] and Tranquilizer[®].

The use of non-OEM replacement parts will void (or negate) agency certifications, including CE, ATEX, CSA, 3A and EC1935 compliance (Food Contact Materials). Warren Rupp, Inc. cannot ensure nor warrant non-OEM parts to meet the stringent requirements of the certifying agencies.

> ~ See sandpiperpump.com/content/warranty-certifications for complete warranty, including terms and conditions, limitations and exclusions. ~

Declaration of Conformity

Manufacturer: Warren Rupp, Inc., 800 N. Main Street Mansfield, Ohio, 44902 USA

Certifies that Air-Operated Double Diaphragm Pump Series: HDB, HDF, M Non-Metallic, S Non-Metallic, M Metallic, S Metallic, T Series, G Series, U Series, EH and SH High Pressure, RS Series, W Series, F Series, SMA and SPA Submersibles, and Tranquilizer® Surge Suppressors comply with the European Community Directive 2006/42/EC on Machinery, according to Annex VIII. This product has used Harmonized Standard EN809:2012, Pumps and Pump Units for Liquids - Common Safety Requirements, to verify conformance.

WARREN RUPP, INC. Declaration of Conformity

Manufacturer: Warren Rupp, Inc., 800 N. Main Street, Mansfield, Ohio, 44902 USA certifies that SANDPIPER® Air-Operated Double Diaphragm Food Processing Pump Models and Tranquilizer® Surge Suppressor Models comply with the European Community Regulations:

(EC) No 1935/2004 for Food Contact Materials

(EC) No 2023/2006 Good Manufacturing Practice

(EU) No 10/2011 on plastic materials and articles intended to come in contact with food

- Materials used in equipment intended for food contact (Annex I (EC) No 1935/2004):
 - Rubber Metals & Alloys Plastics

Plastic Materials: PTFE and FKM/ PTFE coated

The plastic components are suitable to come in contact with multiple food types, provided that storage contact time does not exceed 1/2 hour, contact temperature does not exceed 40°C and maximum operating temperatures within the instructions manual are not exceeded. Diaphragm failure may allow process fluids to come in contact with nonconforming materials. Regular inspections are recommended.

- This Declaration is based on :
 - Declaration of Conformities from raw material suppliers
 - Total Migration Analysis per (EU) No 10/2011
- · Supporting document will be made available to competent authorities to demonstrate compliance

EU Declaration of Conformity

Manufacturer:

Warren Rupp, Inc. A Unit of IDEX Corporation 800 North Main Street Mansfield, OH 44902 USA

Warren Rupp, Inc. declares that Air Operated Double Diaphragm Pumps (AODD) and Surge Suppressors listed below comply with the requirements of **Directive 2014/34/EU** and all applicable standards.

Applicable Standards

- EN ISO 80079-36: 2016
- EN ISO 80079-37: 2016
- EN ISO 60079-25: 2010
- 1. AODD Pumps and Surge Suppressors Technical File No.: 20310400-1410/MER

Hazardous Location Applied:

II 2 G Ex h IIC T5...225°C (T2) Gb
